New function inspired by our customer needs

SECOLUTION is a set of tools that facilitates key business decisions making. Tools are designed for specialists by specialists.

You can create a competitive advantage in a mindful and responsible way

Advanced SECOLUTION functions facilitate the analysis of key decisions in the optimization of heat treatment process. Innovative solutions offered by SECO/WARWICK enable you to better understand, control and use the existing machine ecosystem for gaining a competitive edge.

How you can benefit from SECOLUTION support

1. SECO/PREDICTIVE

This is a smart tool for detecting failures before they occur. SECO/PREVENTIC is a custom-designed maintenance management system which capitalizes on the solutions in Industry 4.0 and the Internet of Things (IoT), supported by an interactive calendar of scheduled technical inspection and service work. A computer-aided maintenance system minimizes unplanned production downtime and increases equipment availability.

2. SECO/STATISTICS

SECO/STATISTICS is software for monitoring and analyzing the most important measures of equipment utilization such as availability, performance, breakdown, repairs, maintenance, loading/unloading. Due to the advanced analysis and user-friendly graphic design of reports, the system enables effective equipment utilization and optimal downtime scheduling.

3. SECOPTIMIZER

The enhanced use of the machine ecosystem is facilitated by the optimization of batch queuing. SECOPTIMIZER software monitors the timing of manufacturing recipes as well as the heat treatment process operation, automatically managing loading and unloading. The SECOPTIMIZER lowers the cost of equipment utilization measurably by downtime reduction and maximizing production efficiency.

4. SENERGY

SENERGY is an advanced, distributed system of energy measurement dedicated for monitoring, controlling, reporting and energy consumption optimization. SENERGY package supports more effective analysis as well as planning peak and temporary energy demand, minimalizing overall energy costs at the same time.

MES takes a full advantage of the company's entire IT capabilities, including the complete manufacturing process. Selected functionalities include:

- A real-time visualization and management of energy and manufacturing resources
- Alerts and incidents displaying
- Heat treating recipe management
- Remote diagnostic and the data access via the Internet
- Data back-up
- Batch labelling with barcodes or QR systems
- Remote incident alerts on phone or mailbox
- Periodic and batch reports generating
- Advanced data analytics

5. MANUFACTURING EXECUTION SYSTEM (MES)

An access to past performance data on heat treating processes
